Mike had already been working on AutoLISP programming, but approached Richard with a request to adapt it to CAD. Richard wanted a word processor application for the Apple II, so he spent several months learning the Mac programming language, creating several different products before he settled on the CAD application. The two men were convinced that CAD needed a user-friendly user interface and approached the Apple II with the notion that it would work best if the user could see what they were drawing. AutoCAD 1.0 was released on December 14, 1982, and was the first fully integrated CAD system for the Apple II. It used a 100% object-oriented programming system, and had a simple user interface (UI). Active X control In the 1997 release, AutoCAD was the first major AutoCAD product to include an ActiveX control. The ActiveX control is composed of four elements: a host application that interprets the control's code, an interface to the control, the control's code itself and an optional associated data file. The host application is AutoCAD itself, and there are five standard ActiveX controls: the property sheets (properties), the menu, the toolbars (buttons), the dialog (dialog boxes) and the command line (command window). The commands of the command line are processed by the interface, which represents a request for an action from the control (i.e., a mouse click, a keyboard input, a menu item selection). In the user interface, a standard feature is a command window in which one can enter data or run a command. The property sheet is used to manage a collection of properties, each with a name and a value. They are independent of the active drawing, so they are maintained even when the drawing is set to a new location or a new database. Each property sheet is bound to a drawing, and to each property sheet, there is a hierarchy of property sheets. Property sheets can be nested, but any set of nested property sheets is independent of any other set. Properties can be set by using the menu system, or by using the property sheet. The property sheet is like a property, but it is used to manage the whole set of properties. A property sheet can have an unlimited number of properties, so it is not bound to the drawing. History Development timeline The first version of AutoCAD, released in 1982, was developed in MS-DOS. It was the first major software product released under the AutoCAD brand. The first version released after that was version 2, which was released in 1987. In 1987, there was a move away from the older GIS (Geographic Information System) based programming approach to a new object-based programming approach, which is called OOP (Object-Oriented Programming). This included splitting the product into smaller, more specialized programs, which were known as acad.dll, acad.opt.dll and acadint.dll. AutoCAD 2000 (released in 1999) was a major upgrade of the previous version, and marked the beginning of the current version numbering cycle. The next major upgrade, AutoCAD 2002, was released in 2001. It a1d647c40b
